INFORMATION FOR AUTHORS

Full details of how to submit a manuscript for publication in Natural Product Communications are given in Information for Authors on our Web site <http://www.naturalproduct.us>.

Authors may reproduce/republish portions of their published contribution without seeking permission from NPC, provided that any such republication is accompanied by an acknowledgment (original citation)-Reproduced by permission of Natural Product Communications. Any unauthorized reproduction, transmission or storage may result in either civil or criminal liability.

The publication of each of the articles contained herein is protected by copyright. Except as allowed under national "fair use" laws, copying is not permitted by any means or for any purpose, such as for distribution to any third party (whether by sale, loan, gift, or otherwise); as agent (express or implied) of any third party; for purposes of advertising or promotion; or to create collective or derivative works. Such permission requests, or other inquiries, should be addressed to the Natural Product Inc. (NPI). A photocopy license is available from the NPI for institutional subscribers that need to make multiple copies of single articles for internal study or research purposes.

To Subscribe: Natural Product Communications is a journal published monthly. 2011 subscription price: US\$1,995 (Print, ISSN# 1934-578X); US\$1,995 (Web edition, ISSN# 1555-9475); US\$2,495 (Print + single site online); US\$595 (Personal online). Orders should be addressed to Subscription Department, Natural Product Communications, Natural Product Inc., 7963 Anderson Park Lane, Westerville, Ohio 43081, USA. Subscriptions are renewed on an annual basis. Claims for nonreceipt of issues will be honored if made within three months of publication of the issue. All issues are dispatched by airmail throughout the world, excluding the USA and Canada.

Validation of the Ethnopharmacological Use of *Polygonum persicaria* for its Antifungal Properties

Marcos Derita* and Susana Zacchino

Pharmacognosy Area, Faculty of Biochemical and Pharmaceutical Sciences, National University of Rosario, Suipacha 531, Rosario, 2000, Argentina

mgderita@hotmail.com

Received: November 13th, 2010; Accepted: March 16th, 2011

Polygonum L. genus (Polygonaceae) is represented in Argentina by 21 species and some of them have been used in the traditional medicine of our country to treat affections related with fungal infections, such as skin ailments and vaginal diseases. With the aim of contributing to the correct ethnopharmacological use of this genus, in the present work we describe the antifungal properties of *P. persicaria* (species not studied up to now) and the bio-guided isolation of the main active compounds. Results showed that dichloromethane extracts was the most active with MICs (Minimum Inhibitory Concentrations) between 31.2 – 1000 µg/mL, validating the ethnopharmacological use of *P. persicaria* to treat affections related with fungal infections in the Argentinean traditional medicine.

Keywords: Validation, Ethnopharmacological use, *Polygonum*, Antifungal activity.

Since the early 1980s, fungal infections have emerged as major causes of morbi-mortality, mainly among immunocompromised patients. The majority of deaths were associated with species of *Candida*, *Aspergillus* and *Cryptococcus* [1]. Instead, dermatophytes such as *Trichophyton* and *Microsporum* spp. produce superficial infections (tineas) which are usually not threatening but dramatically diminish the quality of life of human beings [2]. Although it appears to be an array of antifungal agents (polyenes, azoles, allylamines and the recent echinocandins) there are, in fact, few therapeutic options. Decreased susceptibilities of yeasts to the currently available antifungal agents [3] added to the increase in the number of reported cases of resistance [4], have led to a general consensus that new efforts for detecting novel antifungal entities remain a priority. In this context, the study of plants with history of ethnopharmacological use for ailments related to fungal infections, can serve two goals: validation of the use of traditional medicines and finding new leads [5].

Polygonum L. genus (Polygonaceae) is represented in Argentina by 21 species and some of them have been used to treat affections related with fungal infections, such as skin ailments and vaginal diseases [6]. Previous studies of this genus reported that *P. punctatum* possessed antifungal properties against yeasts and dermatophytes [7]. With the aim of contributing to the correct ethnopharmacological use of this genus, in a previous work we described the antifungal properties of *P. acuminatum* [8] and in this work we describe those of *P. persicaria* (species not studied up to now) and the bio-guided isolation

Figure 1: A) Sesquiterpene [polygodial (1) and isopolygodial (2)] and B) flavonoids [pinostrobin (3), flavokawin B (4) and cardamomin (5)] isolated from *P. persicaria* DCM extract.

of two sesquiterpene dialdehydes: polygodial (1), isopolygodial (2), and three flavonoids: pinostrobin (3), flavokawin B (4) and cardamomin (5) (Figure 1). Compounds 1 and 2 were previously isolated from *Drymis* spp. [9,10], *P. punctatum* [7] and *P. acuminatum* [8], while compounds 3-5 were previously isolated from *Boesenbergia pandurata*, *Myrica pensilvanica*, *P. ferrugineum* and *Piper* spp [11-13].

Compounds 1-5 were evaluated for their antifungal activities with the microbroth dilution assay recommended by the Clinical and Laboratory Standards Institutes (CLSI)

Ca: *Candida albicans* ATCC 10231; *Sc*: *Saccharomyces cerevisiae* ATCC 9763; *Cn*: *Cryptococcus neoformans* ATCC 32264; *Afu*: *Aspergillus fumigatus* ATCC 26934; *Afl*: *Aspergillus flavus* ATCC 9170; *An*: *Aspergillus niger* ATCC 9029; *Mg*: *Microsporium gypseum* C 115; *Tr*: *Trichophyton rubrum* C 113; *Tm*: *Trichophyton mentagrophytes* ATCC 9972. I: inactive = MIC > 250 $\mu\text{g/mL}$.

[14] and results are shown in Table 2. They were active against yeasts, *Aspergillus spp.* and dermatophytes with MICs between 3.90 - 250 $\mu\text{g/mL}$

As it can be observed in Table 2, the five compounds isolated from *P. persicaria*, drimanes as well as flavonoids, all showed antifungal activity. Among them, polygodial (**1**) showed the best activity against yeasts and dermatophytes with MICs between 3.9 to 62.5 $\mu\text{g/mL}$ and it was almost inactive against species of *Aspergillus* genus. Its epimer, isopolygodial (**2**), showed a lower antifungal activity (MICs between 31.2 to 250 $\mu\text{g/mL}$), suggesting that the C-9 configuration plays an important role in the antifungal activity, as we have been found in a previous paper [8].

Regarding flavonoids **3-5**, there is not a clear difference among the antifungal activities of them against yeasts and *Aspergillus spp.* Nevertheless, chalcone **5** showed a high antifungal activity against *T. rubrum* and *T. mentagrophytes* with MICs = 15.6 $\mu\text{g/mL}$, eight times higher than the activity showed by chalcone **4** against the same strains. This striking difference in activity against *Trichophyton spp.* could be attributed to the phenolic OH present in compound **5** which is absent in **4**.

These results show that the antifungal activity of *P. persicaria* could be attributed to polygodial but it is clear that the rest of the isolated compounds could contribute to the antifungal behavior of this traditional used species. In addition, these results validate the ethnopharmacological use of *P. persicaria* to treat affections related to fungal infections in the Argentinean traditional medicine and add a new evidence that the ethnopharmacological approach is

useful in guiding the discovery of antifungal compounds against dermatophytes, as it was demonstrated in a recent survey among seven Latinoamerican countries [15].

Experimental

Extracts preparation and compounds isolation: Air-dried aerial parts of each species (100 g) were powdered and successively macerated (3 \times 24 h each) with Hexane (Hex), dichloromethane (DCM), ethyl acetate (EtOAc) and methanol (MeOH) with mechanical stirring to obtain the corresponding extracts, after filtration and evaporation. Bioassay-guided fractionation of DCM extract allowed us to isolate the compounds responsible for the antifungal activity. 1.1 g of *P. persicaria* DCM extract were submitted to column chromatography using mixtures of Hex: AcOEt in increasing polarity as elution solvents. We obtained 10 fractions; three of them were actives (fractions 6-8). From 150 mg of fraction 6, by repeated column chromatography, we obtained 55 and 30 mg of compounds **1** and **2** respectively. From 170 mg of fraction 7, by repeated column chromatography, we obtained 50, 46 and 25 mg of compounds **3**, **4** and **5** respectively. Additionally, from 70 mg of fraction 8, we obtained 10 mg of compound **5**. All the compounds were characterized by UV-visible, IR, ^1H NMR and ^{13}C NMR spectroscopy.

Antifungal assay: For the antifungal evaluation, strains from the American Type Culture Collection (ATCC, Rockville, MD, USA) and Centro de Referencia en Micología, CEREMIC [C, Faculty of Biochemical and Pharmaceutical Sciences, Suipacha 531 (2000)-Rosario, Argentina] were used: *Candida albicans* (*Ca*) ATCC 10231, *Saccharomyces cerevisiae* (*Sc*) ATCC 9763, *Cryptococcus neoformans* (*Cn*) ATCC 32264, *Aspergillus*

flavus (Afl) ATCC 9170, *Aspergillus fumigatus* (Afu) ATCC 26934, *Aspergillus niger* (An) ATCC 9029, *Trichophyton rubrum* (Tr) C 110, *Trichophyton mentagrophytes* (Tm) ATCC 9972 and *Microsporium gypseum* (Mg) C 115. Strains were grown on Sabouraud-chloramphenicol agar slants for 48 h at 30 °C, maintained on slopes of Sabouraud-dextrose agar (SDA, Oxoid) and subcultured every 15 days to prevent pleomorphic transformations. Inocula of cell or spore suspensions were obtained and quantified following reported procedures (CLSI).[14]

Minimum Inhibitory Concentration (MIC) of each extract or compound was determined by using broth microdilution

techniques according to the guidelines of CLSI for yeasts: document M27-A2 and for filamentous fungi, M38A. For the assay, stock solutions of extracts or pure compounds (100 µL) were two-fold diluted with the culture medium. A volumen of 100 µL of inoculum suspension [adjusted to $1-5 \times 10^4$ cells/spores as Colony Forming Units (CFU/mL)] was added to each well with the exception of the sterility control where sterile water was added to the well instead. Ketoconazole (Sigma Chem. Co., St. Louis, MO), Terbinafine (Novartis) and Amphotericin B (Sigma) were used as positive controls.
