23 **Abstract**  
24

25  
26  
27  
28 With the aim to develop synthetic tools for the characterization of  
29 galactofuranosyltransferases, the synthesis of 9-decenyl glycosides of D-Man<sub>p</sub>, D-Galf and β-  
30 D-Galf-(1→3)-D-Man<sub>p</sub> was targeted. The interest in the alkenyl aglycone arises from its  
31 potential conjugation reactions, once the terminal double bond has been conveniently  
32 functionalized. The glycosylation of β-D-Galf-(1→3)-D-Man<sub>p</sub> was attempted by two different  
33 approaches: the trichloroacetimidate method and the glycosylation via the glycosyl iodide.  
34 The conditions for the latter were established on the basis of glycosylation assays of per-*O*-  
35 acetylmannose. On the other hand, the study of glycosylation reactions *via* per-*O*-benzoylated  
36 galactofuranosyl iodide confirms the versatility of glycosyl iodides as donors.

4 Among the numerous structures of pathogenic microorganisms in which D-  
5 galactofuranose occurs,<sup>1</sup> the disaccharide  $\beta$ -D-Galf-(1 $\rightarrow$ 3)-D-Manp (**1**, Figure 1) is found in  
6 glycoconjugates of protozoa (*Trypanosoma cruzi* and *Leishmania* spp.) and in fungi, as  
7 *Aspergillus fumigatus*<sup>2,3</sup>. In *T. cruzi*, motif **1** is present as non-reducing terminal units of the  
8 glycoinositolphospholipids (GIPLs),<sup>4,6</sup> which are important for the interaction with the  
9 intestine of the insect vector.<sup>7</sup> In *Leishmania*, disaccharide **1** is present as an internal unit in  
10 the lipophosphoglycan (LPG),<sup>8</sup> which was also shown to play a critical role in the attachment  
11 of *Leishmania* promastigotes to the fly midgut.<sup>9</sup>

23  
24 For elucidating the biosynthesis of D-Galf containing glycoconjugates, synthetic  
25 substrates of the involved enzymes are required.<sup>10-12</sup> Oligosaccharides containing the  $\beta$ -D-  
26 Galf-(1 $\rightarrow$ 3)-D-Manp (**1**) motif have been synthesized,<sup>13,14</sup> as well as some derivatives of **1**,  
27 which were afforded by different approaches.<sup>15</sup> We have described the synthesis of free  
28 disaccharide **1** using the glycosyl-aldonolactone approach, and we have shown that is  
29 hydrolyzed by the *exo*  $\beta$ -D-galactofuranosidase of *P. fellutanum*, our non-pathogenic model to  
30 evaluate the synthetic tools developed for studying the D-Galf related enzymes.<sup>16</sup>

**Figure 1.** Synthetic targets.

With the aim of obtaining a derivative of **1** for the characterization of the galactofuranosyltransferases of *P. fellutanum* and *T. cruzi*, we have now targeted the synthesis of 9-decenyl  $\beta$ -D-Galf-(1 $\rightarrow$ 3)-D-Manp (**2**, Figure 1), which is expected to be an acceptor of D-Galf units and as precursor of other derivatives designed to study the immunogenic activity of **1**. For the synthesis of **2** it was necessary to introduce the alkenyl moiety with a glycosylation method that would preserve the Galf-(1 $\rightarrow$ 3)-Manp linkage. We decided to carry on this synthesis by two alternative approaches: one based on the trichloroacetimidate method, which required transformations that we have previously applied,<sup>17,18</sup> and the other involving a glycosyl iodide donor (Scheme 1). In this case, the conditions for the glycosylation of the acetylated mannose unit must be established. For the glycobiological studies, we have also decided to synthesize acceptors **3** and **4** (Figure 1). The optimized conditions for the synthesis of **3** would be useful for the glycosylation of **1**. On the other hand, as continuation of our studies on the scope of glycosylations *via* galactofuranosyl iodides,<sup>18-20</sup> this reaction was investigated for the synthesis of compound **4** from acylated precursors of D-Galf. Thus, we report here the studies of glycosylations of per-*O*-acetylmannose *via* glycosyl iodides, the exploration of the galactofuranosylation *via* iodides prepared from per-*O*-acylated precursors, and the synthesis of glycosyl disaccharide **2**.

**Scheme 1.** Retrosynthetic approaches for 9-decenyl  $\beta$ -D-Galf-(1 $\rightarrow$ 3)-D-Manp (**2**)

For the synthesis of mannopyranoside **3** we used the glycosyl iodide method starting from penta-*O*-acetyl- $\alpha,\beta$ -D-mannopyranose (**5**). In first instance, we established the reaction conditions for the formation of the mannopyranosyl iodide and its subsequent glycosylation, in order to apply similar conditions to the synthesis of disaccharide **2**. According to the reported conditions for similar substrates,<sup>21,22</sup> compound **5** was treated with TMSI (2.4 equiv) at room temperature and after 2 h, the medium was neutralized with EtN(*i*Pr)<sub>2</sub>, and 9-decen-1-ol was added as acceptor (Scheme 2). Under this conditions, starting compound **5** was not completely consumed, and the reaction proceeded slowly towards the formation of a main product, but on the basis of the <sup>13</sup>C NMR spectrum, this compound was identified as the orthoester **7** (Table 1, entry 1).<sup>23,24</sup>

Attempts to rearrange the orthoester **7** with TMSOTf<sup>25,26</sup> were not satisfactory as, although the NMR spectra of the crude product showed the formation of **8**, a complex mixture of products has been obtained as result of partial *O*-deacetylation.

**Scheme 2.** Synthesis of 9-decyl  $\alpha$ -D-mannopyranoside (**3**)

It has been reported that ZnI<sub>2</sub> accelerates the formation of peracylated glycosyl iodides and prevents the formation of the orthoester.<sup>21,22</sup> The ZnI<sub>2</sub> also acted as a iodide source and in

**Table 1.** Reaction conditions assayed for glycosylation of penta-*O*-acetyl-D-mannopyranose (**5**) via mannosyl iodide.

Entry	Iodide <b>6</b> formation			Glycosylation			
	TMSI (equiv)	ZnI <sub>2</sub> (equiv)	Conditions	Base/promoter (equiv)	MS 4Å	Conditions	Products/Observations
1	2.4		25 °C, 2 h	EtN( <i>i</i> Pr) <sub>2</sub> (2.4)	-	25 °C, 144 h	<b>7</b> (50 %)
2	1.5	0.4	45 °C, 0.5 h	ZnI <sub>2</sub> (1.0)	yes	45 °C, 3.5 h	<b>8</b> (46%) (80% after reacetylation)

this way the halogen exchange in the anomeric carbon, that would occur with other halogenated Lewis acids, was avoided. Hence, ZnI<sub>2</sub> was added in a substoichiometric amount and iodide **6** was formed in just 0.5 h (Table 1, entry 2). As the glycosylation of acylated iodides generally requires a promoter,<sup>23,24</sup> after the complete transformation of **5** into **6**, an additional amount of ZnI<sub>2</sub> was added together with the 4Å powdered molecular sieves. They were not used in the first step because it has been reported that they retard the iodide formation.<sup>23,24</sup> Under these conditions the 9-decenyl glycoside **8** was obtained as major product (46 %), along with an important amount of partially de-*O*-acylated products. Therefore, after reacetylation, compound **8** was obtained in 80 % combined yield (Table 1, entry 2). The NMR spectra of **8** showed that the glycosylation occurred with complete 1,2-*trans* stereoselectivity, due to participation of the neighboring acetyl group on O-2. *O*-Deacetylation of crude compound **8** afforded **3** in 80 % overall yield from **5**.

The synthesis of **8** and **3** as precursors of oligosaccharides present in the antigenic lipophosphoglycan of *Leishmania donovani*, had been previously accomplished by the Koenigs-Knorr method from acetobromomannose.<sup>27</sup> The glycosyl iodide method here

1  
2  
3  
4 described, besides avoiding the use of mercuric salts, affords **8** in higher yield, and the  
5  
6 complete NMR spectroscopic characterization of both **8** and **3** is now provided.  
7  
8

9  
10 Previously, we have described the synthesis of per-*O*-TBS- $\beta$ -D-galactofuranose (**9**) and  
11 its glycosylation by *in situ* activation with TMSI as the galactofuranosyl iodide **12** (Scheme  
12 3). Compound **12** was effectively glycosylated to afford *O*-,<sup>18</sup> *S*-, *C*-galactofuranosides,<sup>20</sup> and  
13 some nitrogenated derivatives,<sup>19</sup> under mild conditions compatible with labile acceptors.  
14  
15 Recently, the lipoteichoic acid from *Streptococcus* sp. DSM 8747 has been synthesized by  
16 glycosylation of **9** via the galactofuranosyl iodide, and the method showed to be significantly  
17 more efficient than those using traditional glycosyl donors.<sup>28</sup> Condensation of persilylated **9**  
18 with 9-decen-1-ol under the conditions previously described,<sup>18</sup> afforded glycoside **14** in 83 %  
19 yield as an anomeric mixture  $\beta/\alpha$  in a 3:1 ratio. A similar diastereoselectivity was observed  
20 with simple acceptors, which was increased when bulky acceptors were used.<sup>18</sup> *O*-Desilylation  
21 of **14** with TBAF afforded the free galactofuranoside **4** in 66 % yield.

36 Although  $\beta$ -D-galactofuranosides can be stereoselectively obtained by neighboring-  
37 group participation from acylated precursors using SnCl<sub>4</sub> or other Lewis acids<sup>3</sup> as promoters,  
38 the glycosyl acceptors are limited to acid stable derivatives. We aimed to investigate the scope  
39 of the galactofuranosyl iodide glycosylations from the easily available peracylated Galf  
40 derivatives **10**<sup>29</sup> and **11**,<sup>30</sup> which are expected to give glycosides with higher  
41 diastereoselectivity than **9**, due to the anchimeric effect. In order to optimize the reaction  
42 conditions, *n*BuOH was employed as a model acceptor. As peracylated precursors are less  
43 reactive than persilylated,<sup>31-33</sup> more drastic conditions than those employed for **9** would be  
44 required. The assayed conditions involving variations in the amounts of TMSI, temperature  
45 and reaction time are summarized in Table 2. The effect of molecular sieves and promoters

was also examined. As expected, **11** was more reactive than **10**, but less than **9** (Table 2, entries 1-3). The best condition for the preparation of iodide **13**, in the absence of a catalyst or a promoter, was the treatment of **11** with 3 equiv of TMSI (Table 2, entry 5). Compound **10** required 4.5 equiv of TMSI to complete the reaction (Table 2, entry 4). Iodide **13** was not stable enough to be isolated.

The addition of powdered molecular sieves during the second step of the reaction avoided the formation of TMSOAc and TMSOBz<sup>23,34</sup> and the subsequent reaction with **13**, which would afford **10** and **11** as recombination products.

The effect of the addition of ZnI<sub>2</sub> during the iodide formation was also studied (Table 2, entries 6-8). In the presence of 0.6 equiv of ZnI<sub>2</sub>, compound **13** was formed at room temperature with only 1.2 equiv of TMSI and in 0.5 h (Table 2, entry 8). When the amount of ZnI<sub>2</sub> was reduced, the consumption of acetate **11** was not complete, although the formed iodide was consumed in 1 h (Table 2, entries 7 and 8). The best results were obtained conducting the reactions at room temperature, without the need of heating to 45 °C, as in the case of the mannopyranosyl iodide **6**.

**Scheme 3.** Synthesis of *O*-galactofuranosides *via* in situ formed galactofuranosyl iodides.

**Table 2.** Reaction conditions assayed for *O*-glycosylations via in situ formed galactofuranosyl iodides.

<sup>a</sup>Estimated by TLC, <sup>b</sup>Isolated by column chromatography

Under the optimized conditions established for the synthesis of **15** (Table 2, entry 8), the analogous decenyl glycoside **16** was obtained in 66 % yield, mainly in the β-configuration (9:1). *O*-Debenzoylation of **16** with NaOMe/MeOH in CH<sub>2</sub>Cl<sub>2</sub> afforded **4** in almost quantitative yield. The β-configuration of the major component of **16** and **4** was confirmed on the basis of the <sup>13</sup>C NMR spectra, which showed characteristic resonances for C-1 (105.6 and 109.4 ppm, respectively) and signals corresponding to C-2 and C-4 above 80 ppm, also characteristic of the β-D-Galf configuration.

Despite the convenience of the use of iodide **13** to achieve stereoselectively β-D-galactofuranosides, the disarmed character of this benzoylated iodide was evidenced when allylTMS, (TMS)<sub>2</sub>S or 2,4,6-tri-*O*-benzoyl-D-manono-1,4-lactone were used as acceptors.

While these compounds were effectively coupled with **9**,<sup>18,20</sup> the glycosylation of **13** failed.

**Scheme 4.** Synthesis of 9-decanyl β-D-Galf-(1→3)-D-Manp (**2**).

Both strategies designed to accomplish the synthesis of the decenyl glycoside **2**, required per-*O*-acetylated disaccharide **17**, which was afforded as an anomeric mixture in 75 % yield by treatment of **1**<sup>16</sup> with Ac<sub>2</sub>O/py (Scheme 4). The approach involving a trichloroacetimidate donor required the selective anomeric *O*-deacetylation of **17**. Hence, **17** was treated with ethylenediamine and acetic acid to afford the hemiacetal **18** in 84 % yield (Scheme 4), exclusively in the α-configuration as indicated by the <sup>1</sup>H NMR spectrum. Treatment of **18** with trichloroacetonitrile and DBU afforded the trichloroacetimidate **20** (83 %). Glycosylation of **20** with 1.5 equiv of 9-decen-1-ol in CH<sub>2</sub>Cl<sub>2</sub> using TMSOTf as catalyst gave **21** in 72 % yield. The NMR spectra showed that, despite the anchimeric assistance from

1  
2  
3  
4 the participating acetyl group at O-2, compound **21** was obtained as an inseparable mixture of  
5  
6  $\beta/\alpha$  anomers, in a 3:2 ratio. The  $^{13}\text{C}$  NMR spectrum showed resonances at 102.7 and 102.5  
7  
8 ppm corresponding to C-1' of the  $\beta$ - and the  $\alpha$ -anomers, respectively, and signals at  $\delta$  99.6  
9  
10 (C-1 $\beta$ ) and 99.2 (C-1 $\alpha$ ) due to the mannopyranosyl unit. The  $^1\text{H}$  NMR spectrum showed  
11  
12 singlets at 5.19 and 5.13 ppm for H-1' of the  $\beta$ - and the  $\alpha$ -anomers, respectively, and doublets  
13  
14 at 4.90 (H-1 $\alpha$ ) and 4.52 ppm (H-1 $\beta$ ) for the mannopyranosyl unit.  
15  
16  
17  
18

19  
20 On the other hand, peracetylated compound **17** was treated with TMSI/ZnI<sub>2</sub>, according  
21  
22 to the conditions optimized for the formation and glycosylation of iodide **6** (Table 1, entry 2),  
23  
24 although a greater amount of ZnI<sub>2</sub> (0.7 equiv) was necessary to obtain iodide **19**. Then, 9-  
25  
26 decen-1-ol and 4Å powdered molecular sieves were added (Scheme 4). Compound **21** (78 %)  
27  
28 was obtained, along with a small amount of **18**.  
29  
30

31  
32 In the  $^1\text{H}$  NMR spectrum of **21** obtained in this way, it was observed that an anomeric  
33  
34 mixture in a  $\beta/\alpha$  ratio of 3:2 was actually obtained. This ratio was almost equal to that  
35  
36 obtained in the glycosylation *via* the trichloroacetimidate **20**, suggesting that the  
37  
38 stereoselectivity depends on the substrate itself rather than the glycosylation method used.  
39  
40 Probably, the  $\beta$ -D-Galp unit as substituent on the O-3 of D-Manp would be responsible for a  
41  
42 distortion in the intermediate bicyclic 1,2-acyloxonium ion, making the anchimeric  
43  
44 participation less efficient.  
45  
46  
47  
48

49 Finally, de-*O*-acetylation of **21** with NaOMe/MeOH in CH<sub>2</sub>Cl<sub>2</sub> afforded **2** in  
50  
51 quantitative yield (Scheme 4). The  $^1\text{H}$  NMR spectrum of **2**, showed signals corresponding to  
52  
53 H-1' ( $\delta$  5.04 and 5.00) of both anomers, which correlated with signals at 104.3 and 105.4 ppm  
54  
55 in the HSQC experiment. The broad singlets at  $\delta$  4.74 (H-1 $\alpha$ ) and 4.47 (H-1 $\beta$ ) corresponding  
56  
57 to the Manp unit, correlated with signals at 99.9 (C-1 $\beta$ ) and 99.7 (C-1 $\alpha$ ) ppm. The assignment  
58

4 of the anomeric configuration in the Man<sub>p</sub> moiety was confirmed by a 2D NOESY  
5  
6 experiment which showed cross peaks between H-1/ H-3 and H-1/H-5 for the β-anomer.  
7  
8

9  
10 Since its development, the trichloroacetimidate glycosylation method has been widely  
11 used as it has the advantage of being mild enough to preserve other glycosidic linkages  
12 present in the acceptor or in the donor.<sup>35</sup> This aspect is particularly critic in the case of  
13 furanosyl units, due to their lability. Glycosyl iodides have long been underused as they were  
14 considered too reactive to be of synthetic utility. However, their use as glycosyl donors has  
15 been revalued over the past 15 years mainly due to the development of new methods of  
16 preparation.<sup>36</sup> Our studies on the glycosylation *via* the benzoylated galactofuranosyl iodide **13**  
17 confirms once more the versatility of glycosyl iodides as donors.

24  
25  
26  
27

28 For the synthesis of **2** by the trichloroacetimidate approach compound **21** was obtained  
29 from **17** in three steps with the corresponding column chromatography purifications in 50 %  
30 overall yield. The synthesis of **21** from **17** by means of the glycosyl iodide strategy involved  
31 two reaction steps and two column chromatography purifications, in 78 % overall yield.  
32 Beyond the yield, the advantage of the iodide approach was that the sequence was shorter and  
33 the reaction times were significantly reduced. On the other hand, in the synthesis of **2** *via* a  
34 mannosyl iodide, we demonstrated that a β-D-Galf unit in the glycosyl donor resists the  
35 glycosylation, without degradation.

Analytical thin layer chromatography (TLC) was performed on Silica Gel 60 F254 (Merck) aluminum supported plates (layer thickness 0.2 mm) with solvent systems given in the text. Visualization of the spots was effected by exposure to UV light and charring with a solution of 10 % (v/v) sulphuric acid in EtOH, containing 0.5 % p-anisaldehyde. Column chromatography was carried out with Silica Gel 60 (230-400 mesh, Merck). Optical rotations were measured with a Perkin-Elmer 343 digital polarimeter. Nuclear magnetic resonance (NMR) spectra were recorded with a Bruker AMX 500 spectrometer. Assignments of  $^1\text{H}$  and  $^{13}\text{C}$  were assisted by 2D  $^1\text{H}$ -COSY and HSQC experiments. High resolution mass spectra (HRMS ESI $^+$ ) were recorded in a Bruker micrOTOF-Q II spectrometer.

### 1.2. 9-Decenyl 2,3,4,6-tetra-*O*-acetyl- $\alpha$ -D-mannopyranoside (**8**)

A suspension of **5** (0.1 g, 0.25 mmol) and  $\text{ZnI}_2$  (0.4 equiv, 0.032 g, 0.1 mmol) in anhydrous  $\text{CH}_2\text{Cl}_2$  (10.0 mL) was stirred under argon atmosphere at 0 °C for 15 min. TMSI (1.5 equiv, 50.0  $\mu\text{L}$ , 0.375 mmol) was slowly added and the stirring was continued for another 15 min. The suspension was allowed to reach room temperature and then heated at 45 °C. After 30 min of stirring TLC analysis showed total consumption of the starting material ( $R_f = 0.36$ , 1:1 hexane/EtOAc) and a single spot of  $R_f = 0.52$  (1:1 hexane/EtOAc). Powdered molecular sieves 4Å and 9-decen-1-ol (0.14 mL, 0.75 mmol, 3.0 equiv) were added. After 3 h of stirring at 45 °C and 18 h at room temperature, the solution was diluted with  $\text{CH}_2\text{Cl}_2$  (250 mL), washed with  $\text{NaHCO}_3$  (ss) (2 x 140 mL) and water (3 x 100 mL), dried ( $\text{Na}_2\text{SO}_4$ ) and concentrated. The residue was purified by column chromatography (3:1→3:2 hexane/EtOAc) affording syrupy compound **8** (0.056 g, 46 %),  $R_f = 0.70$  (1:1 hexane/EtOAc),  $[\alpha]_D +38.4$  ( $c$  0.9,  $\text{CHCl}_3$ ). Lit:<sup>27</sup>  $[\alpha]_D +40$  ( $c$  1,  $\text{CHCl}_3$ ). Fractions of  $R_f = 0.34$  (1:1 hexane/EtOAc) were

#### 21 **1.4. 9-Decenyl 2,3,5,6-tetra-*O*-*tert*-butyldimethylsilyl- $\alpha,\beta$ -D-galactofuranoside (14)**

22  
23 A solution of **9** (0.20 g, 0.26 mmol) in anhydrous CH<sub>2</sub>Cl<sub>2</sub> (10.0 mL) containing dry 4 Å  
24 powdered molecular sieves was cooled to 0 °C and stirred during 10 min under Ar. Then,  
25 TMSI (1.2 equiv, 0.042 mL, 0.32 mmol) was added and the solution was stirred at 0 °C until  
26  
27 TLC monitoring showed complete transformation of **9** into two lower moving products, the 1-  
28 iodo intermediate **12** ( $R_f = 0.70$ , 10:1 hexane-EtOAc) and some 2,3,5,6-tetra-*O*-TBS- $\alpha,\beta$ -D-  
29 galactofuranose ( $R_f = 0.54$ ), formed as a result of the hydrolysis of **12** on the silica gel plate.<sup>16</sup>  
30  
31 9-Decen-1-ol (1.3 equiv, 0.34 mmol, 0.061 mL) and EtN(*i*Pr)<sub>2</sub> (0.054 mL, 0.32 mmol), were  
32 added by syringe. After stirring at room temperature during 2 h the solution was diluted with  
33 CH<sub>2</sub>Cl<sub>2</sub> (250 mL), washed with NaHCO<sub>3</sub> (ss) (2 x 140 mL) and water (3 x 100 mL), dried  
34 (Na<sub>2</sub>SO<sub>4</sub>) and concentrated. The syrup obtained was purified by column chromatography  
35 (99.7:0.3→99.5:0.5 hexane/EtOAc) affording syrupy compound **14** (0.167 g, 83 %) as an  
36 inseparable  $\beta/\alpha$  mixture in a 3:1 ratio, which gave  $R_f = 0.40$  (7:0.1 hexane/EtOAc twice  
37 developed),  $[\alpha]_D -11.7$  ( $c$  1, CHCl<sub>3</sub>). <sup>1</sup>H NMR (CDCl<sub>3</sub>, 500 MHz)  $\delta$  5.81 (m, 1.29H, CH=CH<sub>2</sub>

(m, 2.5H, CH=CH<sub>2</sub>α,β), 5.38–5.34 (m, 2.5H, H-5'α,β), 5.30 (at, *J* = 8.5 Hz, 1.5H, H-4β), 5.28 (dd, *J* = 9.0, 10.0 Hz, 1H, H-4α), 5.19 (s, 1.5H, H-1'β), 5.13 (s, 1H, H-1'α), 5.06 (dd, *J* = 2.1, 6.1 Hz, 1H, H-3'α), 5.02–4.99 (m, 4.5H, H-2'β, CH=CH<sub>a</sub>Hβ, H-3'β), 4.97 (m, 1H, CH=CH<sub>a</sub>Hα), 4.94 (dd, *J* = 0.6, 2.3 Hz, 1H, H-2'α), 4.93 (m, 1H, CH=CH<sub>b</sub>Hα), 4.92–4.90 (m, 2.5H, CH=CH<sub>b</sub>Hβ, H-1α), 4.52 (d, *J* = 1.3 Hz, 1.5H, H-1β), 4.37–4.15 (m, 11.5H, H-6'α,β, H-6α,β, H-4'α,β, H-6'β, H-6β), 4.11 (dd, *J* = 1.4, 3.1 Hz, 1.5H, H-2β), 4.08 (dd, *J* = 2.4, 12.3 Hz, 1H, H-6β), 4.04–4.00 (m, 2H, H-2α, H-3α), 3.91 (dt, *J* = 6.8, 9.5 Hz, 1.5H, OCH<sub>a</sub>Hβ), 3.87 (ddd, *J* = 2.8, 5.3, 10.3 Hz, 1H, H-5α), 3.82 (dd, *J* = 3.1, 9.0 Hz, 1.5H, H-3β), 3.65 (dt, *J* = 6.8, 9.8 Hz, 1H, OCH<sub>a</sub>Hα), 3.59 (m, 1.5H, H-5β), 3.50 (dt, *J* = 6.8, 9.5 Hz, 1.5H, OCH<sub>b</sub>Hβ), 3.42 (dt, *J* = 6.8, 9.8 Hz, 1H, OCH<sub>b</sub>Hα), 2.13–2.06 (CH<sub>3</sub>CO, CH<sub>2</sub>), 1.64–1.54 (CH<sub>2</sub>), 1.40–1.27 (CH<sub>2</sub>). <sup>13</sup>C NMR (CDCl<sub>3</sub>, 125.8 MHz) δ 170.88, 170.84, 170.5, 170.4, 170.0, 169.99, 169.97, 169.7, 169.4, 169.1 (CH<sub>3</sub>CO), 139.2 (2C, CH=CH<sub>2</sub>α,β), 114.2, 114.1 (CH=CH<sub>2</sub>α,β), 102.7 (C-1'β), 102.5 (C-1'α), 99.6 (C-1β), 99.2 (C-1α), 82.4 (C-2'α), 81.6 (C-2'β), 80.5 (C-4'β), 80.1 (C-4'α), 76.1 (C-3'β), 75.7 (C-3'α), 75.0 (C-3β), 74.5 (C-3α), 72.2 (C-5β), 70.1 (OCH<sub>2</sub>), 69.28, 69.27 (C-5'α,β), 68.3 (C-5α), 68.1 (OCH<sub>2</sub>), 67.3 (C-2α), 66.9 (C-4β), 66.8 (C-2β), 66.4 (C-4α), 62.8 (C-6'α), 62.7 (C-6α), 62.6 (C-6β), 62.4 (C-6'β), 33.8–25.9 (CH<sub>2</sub>), 20.9–20.6 (CH<sub>3</sub>CO).

**1.9.2. Glycosyl iodide method.** A suspension of **17** (0.050 g, 0.074 mmol) and ZnI<sub>2</sub> (0.038 g, 0.12 mmol) in anhydrous CH<sub>2</sub>Cl<sub>2</sub> (10.0 mL) was stirred at 0 °C under argon atmosphere. After 15 min TMSI (35 μL, 0.26 mmol) was slowly added and the reaction was allowed to reach room temperature. After 30 min of stirring at 45 °C TLC analysis showed total consumption

of starting material ( $R_f = 0.51$ , 1:3 hexane/EtOAc) and a new compound of  $R_f = 0.64$  (1:3 hexane/EtOAc), presumably **19**. Powdered molecular sieves 4Å (0.5 g) and 9-decen-1-ol (0.04 mL, 0.22 mmol) were then added. After 17 h of stirring at room temperature the reaction mixture was diluted with  $\text{CH}_2\text{Cl}_2$  (250 mL), washed with  $\text{NaHCO}_3$  ss (2 x 140 mL) and  $\text{H}_2\text{O}$  (3 x 100 mL), dried ( $\text{Na}_2\text{SO}_4$ ) and concentrated under reduced pressure. The syrup was purified by silica gel column chromatography (2:1→1:1 hexane/EtOAc) and fractions of  $R_f = 0.59$  (1:3 hexane/EtOAc) afforded compound **21** (0.034 g, 61 %). By reacetylation of the partial deprotected products formed during the purification by column chromatography the yield was improved (78 %).

#### 1.10. 9-Decenyl 3-O-( $\beta$ -D-galactofuranosyl)- $\alpha,\beta$ -D-mannopyranoside (**2**)

To a solution of **21** (0.05g, 0.064 mmol) in 2:1 anhydrous  $\text{CH}_2\text{Cl}_2/\text{MeOH}$  (6 mL) stirred at  $0^\circ\text{C}$ , 1.3 M  $\text{NaOMe}/\text{MeOH}$  (0.75 mL) was added. After 1 h the solution was deionized by elution with  $\text{MeOH}$  through a column of strongly acidic cation exchange resin ( $\text{H}^+$ ). The eluate was evaporated and the residue was dissolved in water and further purified through a RP18 cartridge. Compound **2** (0.031 g, 100%) was obtained as a 2:3  $\alpha/\beta$  anomeric mixture,  $R_f = 0.62$  (7:1:2  $n\text{PrOH}/\text{NH}_3/\text{H}_2\text{O}$ ),  $[\alpha]_D -12.7$  ( $c$  1,  $\text{MeOH}$ ).  $^1\text{H NMR}$  ( $\text{D}_2\text{O}$ , 500 MHz)  $\delta$  5.68 (m, 2.5H,  $\text{CH}=\text{CH}_2\alpha,\beta$ ), 5.04 (s, 1.5H,  $\text{H}-1'\beta$ ), 5.00 (s, 1H,  $\text{H}-1'\alpha$ ), 4.89 (dd, 2.5H,  $J = 6.5$ , 16.7 Hz,  $\text{CH}=\text{CH}_a\text{H } \alpha,\beta$ ), 4.82 (m, 2.5H,  $\text{CH}=\text{CHH}_b \alpha,\beta$ ), 4.74 (s, 1H,  $\text{H}-1\alpha$ ), 4.47 (s, 1.5H,  $\text{H}-1\beta$ ), 4.076 (m, 1.5H,  $\text{H}-2'\beta$ ), 4.05 (m, 2.5H,  $\text{H}-2'\alpha$ ,  $\text{H}-2\beta$ ), 4.03–3.96 (m, 6H,  $\text{H}-3'\alpha,\beta$ ,  $\text{H}-4'\alpha,\beta$ ,  $\text{H}-2\alpha$ , 3.81–3.66 (m, 11H,  $\text{OCH}_a\text{H } \beta$ ,  $\text{H}-5'\alpha,\beta$ ,  $\text{H}-6a \alpha,\beta$ ,  $\text{H}-6b \alpha,\beta$ ,  $\text{H}-3\alpha$ ,  $\text{H}-4\alpha$ ), 3.64–3.51 (m, 9H,  $\text{OCH}_a\text{H}\alpha$ ,  $\text{H}-6'a \alpha,\beta$ ,  $\text{H}-6'b \alpha,\beta$ ,  $\text{H}-3\beta$ ,  $\text{H}-4\beta$ ), 3.50–3.43 (m, 2.5H,  $\text{OCHH}_b\beta$ ,  $\text{H}-5\alpha$ ), 3.33 (m, 1H,  $\text{OCHH}_b\alpha$ ), 3.24 (m, 1.5H,  $\text{H}-5\beta$ ), 1.98–1.88, 1.57–1.45,

**Graphical Abstract**

**Synthetic tools for the characterization of galactofuranosyl transferases. Glycosylations via acylated glycosyl iodides**

Luciana Baldoni and Carla Marino\*

- 9-Decenyl glycosides of D-Man<sub>p</sub>, D-Galf and β-D-Galf-(1→3)-D-Man<sub>p</sub> were synthesized.
- Conditions for glycosylation per-*O*-acetyl-Man<sub>p</sub> iodide were revised and optimized.
- The established conditions were used for the glycosylation of β-D-Galf-(1→3)-D-Man<sub>p</sub>
- Galactofuranosylation *via* per-*O*-benzoyl-β-D-Galf iodide was investigated.
