Xanthium strumarium L., the main species of the genus *Xanthium*, is ubiquitously distributed. The aim of this study was to determine the cytotoxic effect of aerial organs of *X. strumarium*, grown in Cuba, against cancer cell lines and the isolation of compounds potentially responsible for this activity. Initially, an ethanol partitioning procedure yielded the XSE extract that was subsequently fractionated with chloroform resulting in a XSCF fraction. Both, XSE and XSCF fractions exhibited cytotoxic effects on MDA MB-231, MCF7, A549 and CT26 cell lines by using the MTT assay. Above all, the XSCF fraction was more active than XSE. For this reason, XSCF was subsequently fractionated by silica gel chromatography and the active fractions submitted to semi-preparative HPLC for isolation of bioactive compounds. Six sub-fractions (SF1 to SF6) were recovered. Sub-fractions 3 and 6 were the most active on each assayed cell line, while sub-fractions 4 and 5 were only active against A549 and CT26 cell lines. In each case, sub-fraction 6 showed the strongest inhibitory effect. The HPLC-DAD fingerprint of sub-fraction 6 showed a single peak that was identified by GC-MS as (-) spathulenol, a sesquiterpene with reported antitumor activity.

Keywords: *Xanthium strumarium*, Cytotoxic, Bioassay-guided fractionation, (-) Spathulenol.

The genus *Xanthium* (Asteraceae, Compositae), represented by 25 species, exhibits a global distribution and is ubiquitously found throughout Eurasia and America. This genus has been the subject of several studies that led to the isolation of sesquiterpene lactones (xanthanolides) [1a], terpenoids [1b-1d], thiazinediones [1e, 1f], sterols and caffeoylquinic acids [1g], as the main secondary metabolites. *Xanthium* species have long been used as traditional herbal medicines in eastern countries. The whole plant has been used to treat bacterial infections, diabetes, skin pruritus and inflammatory diseases such as rhinitis and rheumatoid arthritis [1h].

X. strumarium L. has also been used in folk medicine in Latin-America against different types of cancers [2a]. In alternative Brazilian medicine, *X. strumarium* has been employed to treat dermatitis [1d], and its leaves have been used by various native American tribes to relieve constipation, diarrhea and vomiting [2b]. Several activities have been confirmed by experimental pharmacology in samples of *X. strumarium* collected in different sites: anti-inflammatory, analgesic [2c, 2d], anticancer [2e-2g], antifungal [2h], antiulcerogenic [2i], antimitotic [2j], antitrypanosomal, antimalarial [2k] and diuretic [2l]. The chemical composition of *X. strumarium* has been found to include phenolic compounds, such as chlorogenic and ferulic acids, triterpenoid saponin, and xanthanolide sesquiterpene lactones (8-epi-xanthatin and 8-epi-xanthatin epoxide) [1d].

However, the chemical composition and concentration of these compounds from the same plant species may vary in response to ecological and plant growth regulators [3]. So far, the chemical composition of *X. strumarium* extracts obtained from Cuban plants has not been reported. In a previous report we demonstrated the inhibitory effect of Cuban *X. strumarium* on tubulin polymerization [4]. Due to the importance of antimitotic agents in anticancer therapy, the aim of this study was to determine the cytotoxic effect of extracts obtained from aerial organs from Cuban *X. strumarium* against cancer cell lines and describe the isolation of some compounds potentially responsible for this activity.

In this paper we elucidate the anticancer potential of *X. strumarium* from Cuba through the evaluation of the cytotoxic effect by using four cancer cell lines corresponding to the most prevalent human cancers (colon, breast, and lung) presenting difficult prognosis.

X. strumarium aerial parts (leaves and stems) were extracted with 70% EtOH; the extract (XSE) was further subjected to chloroform solvent-solvent partitioning, resulting in XSCF fraction. Both, XSE and XSCF samples were assayed for their cytotoxic effects against four cancer cell lines. XSCF showed higher cytotoxic activity than XSE in the assayed cell types. Above all, the XSE and XSCF fractions were more active on the CT26 cell line (IC₅₀ values, as µg/mL, of 58.9±3.2 and 25.3±1.4, respectively) than on others cell lines; MDA MB 231 (IC₅₀ = 61.2±1.0 and 53.3±2.3), MCF7

(IC_{50} =86.1±4.5 and 70.6±0.1) and A549 (IC_{50} =64.2±2.0 and 52.2±3.2). Results are consistent with previous reports using the chloroform fraction from the same source obtained in other locations [2e, 2g, 2n].

For isolation of metabolites with cytotoxic activity, the XSCF was submitted to a silica gel column and the resulting fractions pooled into 5 groups, designated as F1 to F5. The cytotoxicity of the five fractions was measured against A549 and CT26 cell lines. Among them, three fractions viz., F3, F4 and F5 showed high cytotoxic activity against both assayed cells lines (Figure 1A) and F3 was the most active fraction. For this reason, this fraction was further fractionated by HPLC in an attempt to purify the bioactive compound(s). The cytotoxic effect of each obtained sub-fraction (SF1 to SF6) was assayed against each cell line (MDA MB-231, MCF7, A549 and CT26). Sub-fractions 3 and 6 were more active on each cell line assayed, whereas sub-fractions 4 and 5 were only active against A549 and CT26 cells. Sub-fraction 6 had the strongest inhibitory effect, 90%, 70%, 50% and 40% for CT26, A549, MDA MB231 and MCF7, respectively (Figure 1B).

Thirteen chemical species were identified following chemical characterization of fraction F3 by GC-MS (Table 1), among them, benzoic acid, fatty acid derivatives, flavonoids and sesquiterpenic compounds.

The fingerprint by HPLC-DAD of sub-fraction 6 showed a single peak that was identified by GC-MS as (-) spathulenol. The presence of this compound in *X. strumarium* was previously reported [1c, 1d]. In our assaying conditions this sesquiterpene metabolite was responsible for the cytotoxic activity found in the chloroform fraction of *X. strumarium*.

(-)-Spathulenol isolated from leaves of *Dasymaschalum dasymaschalum* exhibited potent cytotoxic activities against human

Table 1: Compounds identified in fraction F3 obtained from *X. strumarium* chloroform fraction (XSCF) by GC-MS

	Retention time	Relative percentage	Identified compounds (nist2008)
C1	9.84	2.4	Limonene
C2	11.80	7.1	Benzoic acid, methyl ester
C3	13.97	0.9	Benzoic acid, ethyl ester
C4	16.98	0.1	Hexanoic acid, 1,1-dimethyl ester
C5	28.28	3.0	Coniferol (<i>trans</i>)

C13	43.16	trace	Naringenin

lung cancer cell lines (NCI-H187) with IC_{50} values of 6.6 μ g/mL [5a]. Several authors have shown that the essential oils (EO) from many plants enriched in (-) spathulenol exhibit moderate to potent cytotoxic activity against several cancer cell lines, such as: CACO-2 (colorectal cancer), Hep-G2 (human hepatocellular carcinoma), HeLa (human ovarian carcinoma), Bel-7402 (human hepatocellular carcinoma), A-549, MCF-7 and A2780 (ovarian carcinoma) [5b-5e]. Other biological activities have been associated with (-)-spathulenol such as, antitumor, immunomodulatory and antibiotic and as an inhibitor of the human ABCB1 efflux pump [5f, 5g].

The present paper reports for the first time the isolation and identification of (-)-spathulenol, a sesquiterpene metabolite, as a cytotoxic compound of aerial organs of *X. strumarium* grown in Cuba.

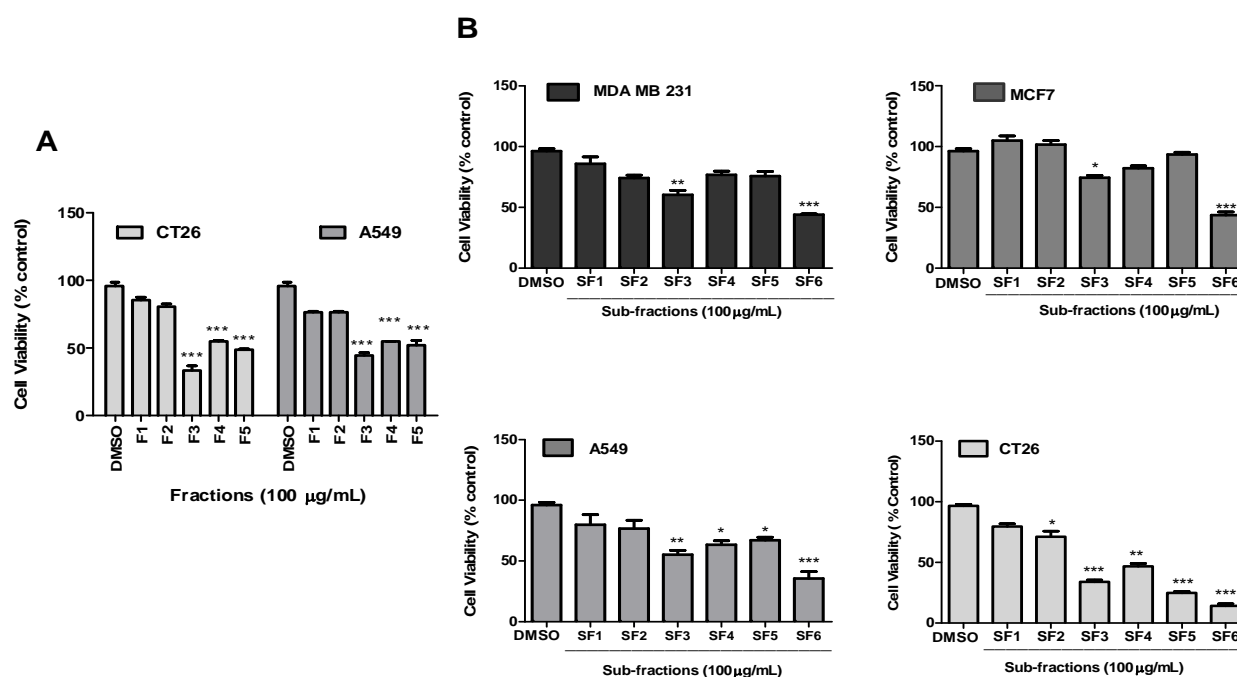

Figure 1: Cytotoxic effects measured with MTT assay of A) fractions (F1-F5) from XSCF on CT26 and A549 cancer cells lines, and B) sub-fractions (SF1 to SF6) obtained from active fraction (F3) of XSCF on MDA MB 231, MCF7, A549 and CT26 cancer cells lines. The cells were treated for 72 h with either fractions or sub-fractions (100 μ g/mL). Data are presented as means \pm SD in three independent experiments. Significance: * p < 0.05, ** p < 0.01, *** p vs. the negative control.

Experimental

Plant material and extraction: *X. strumarium* was collected at the Medicinal Plants Experimental Station “Dr. Juan Tomás Roig” in Artemisa, Cuba. A voucher specimen, number ROIG 4594, was deposited at the herbarium of this institution. The leaves and stems were dried in a dark place at room temperature. The ground material (500 g) was extracted with 70% ethanol by percolation. The solvent was evaporated under vacuum providing 39 g of total extract (yield, 7.8%). The ethanolic extract (XSE) was re-suspended in distilled water (200 mL) and extracted 3 times with benzene to remove non-polar substances (1:3). The remaining aqueous phase was extracted 3 times with chloroform. The resulting fraction was dried under vacuum and termed the chloroform fraction (XSCF) (1.32 g, 3.38%). Both, the ethanolic and chloroform fractions were kept refrigerated at 4°C until use.

Compound isolation: XSCF was dissolved in MeOH and fractionated through a silica gel column (30 x 1.8 cm) with a stepwise elution gradient composed of chloroform: ethyl acetate: methanol (90:10:0; 80:20:0; 70:30:0; 50:50:0; 40:60:0; 20:80:0; 0:100:0; 0:70:30; 0:50:50; 0:0:50 v/v/v). Twenty fractions were collected and pooled into 5 fractions (F1-F5) based on their TLC mobility profiles (Kieselgel G60 F254 0.2 mm, Merck; mobile phase: chloroform: methanol 9:1, v/v) revealed with Natural Products reagent (NP – 1% methanolic solution of diphenylboric acid aminoethyl ester) and a vanillin-sulfuric acid reagent. Fraction F3 (28 mg), was further chromatographed by semi-preparative HPLC using a Phenomenex Ib-Sil C18 column (10 mm x 250 mm, 5 µm) at 40°C. Chromatography was carried out in a HPLC-DAD system consisting of Waters 1525 Binary HPLC Pumps with a 1500 Series Column Heater, a manual injection valve with a 50 µL loop (Rheodyne Inc., Cotati, CA) and a Waters 2998 photodiode array detector (PDA). Gradient elution was carried out with water-0.1% acetic acid (solvent A) and methanol (solvent B) at a constant flow of 1.5 mL/min. The solvent composition was as follows. Initial: 50% B, 50% A, changing to 100% B at 50 min by 5 min for a total running time of 55 min. Six sub-fractions/peaks (SF1 - SF6) were obtained and their cytotoxic activities were measured against 4 cancer cell lines: MDAMB-231 (breast), MCF7 (breast), A549 (lung) and CT26 (colon).

The determination of fingerprints of XSE and each fraction obtained from the silica column was carried out using a HPLC-DAD system consisting of a Waters 1525 Binary HPLC Pumps system with a 1500 Series Column Heater, a manual injection valve with a 20 µL loop (Rheodyne Inc., Cotati, CA) and a Waters 2998 photodiode array detector (PDA). An XBridge™ C18 column (4.6 mm x 150 mm, 5 µm; Waters Corporation, Milford, MA) was used as stationary support. Compounds were monitored at 280 nm and 330 nm. Gradient elution was carried out with 0.1% aqueous acetic acid (solvent A) and methanol- 0.1% acetic acid (solvent B) at a constant flow of 0.5 mL/min. The gradient program was as follows: Initially, 10% B, 90% A, changing to 57% B at 45 min and to 100% B at 60 min, and 5 min before returning to the initial condition. The concentration of injected sample was 3 mg/mL. Data collection was carried out with Empower™ 2 software.

Compounds identification by gas chromatography/mass spectrometry (GC-MS) analyses: GC-MS analyses were performed

on a Trace GC and Polaris Q ion trap mass spectrometer (ThermoFinnigan) with Xcalibur 1.4 SR1 software.

HPLC sub-fractions/peaks obtained from fraction F3 were dissolved in deuterated chloroform for this analysis. The MS detection was performed in the positive ion mode using mass acquisition between 40-500 amu. The temperature program was: 60°C for 3 min, then increased at a rate of 5°C/min to 280°C and the final temperature was held for 10 min. The split-splitless injection port was set at 280°C in the split mode at a split ratio of 1:10. Helium was used as the carrier gas at a constant flow rate of 1.0 mL/min. Compounds were identified by comparison with profiles from literature in the NIST 2008 library and by injection using authentic standards, when available.

Screening for cytotoxicity of the total extract, chloroform fraction and sub-fraction from *X. strumarium*: A stock solution of 2 mg/mL of XSE and XSCF and 1 mg/mL of sub-fractions/isolated compounds were re-suspended in dimethyl sulfoxide (DMSO) for cytotoxic evaluation. The highest concentration of extracts, fractions and compounds tested was 100 µg/mL, as recommended by the NCI's Developmental Therapeutics Program protocol for prescreening of natural products [6].

Cell lines: Four tumor cell lines were used to screen plant extracts for anticancer effects: MDA MB-231 (breast), MCF7 (breast), A549 (lung) and CT26 (colon). MCF7, MDA MB-231 and A549 cells were grown in DMEM medium and CT26 in RPMI 1640 with L-glutamine (Sigma), containing 10% FBS (Sigma) and 100 U/mL penicillin and 100 mg/mL streptomycin (Sigma), in either T-75 cm² or T-25 cm² tissue culture flasks and cultured at 37°C in a humidified incubator containing 5% CO₂. The medium was changed twice a week. Cell stocks were stored in liquid nitrogen for prolonged preservation.

MTT cytotoxicity assay: The MTT [3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide] cytotoxicity assay was carried out in accordance with the protocol described by Mosmann [7] with some modifications. In each well of a culture microplate 1x10⁴ cells were added. After being cultured overnight, cells were exposed to the extract, the chloroform fraction or the isolated compounds for 72 h. At the end of this period, the cells were incubated with MTT (5 mg/mL) for 4 h. The plates were read in a microplate spectrophotometer (Omega) at 550 nm. The samples IC₅₀ values were determined from a dose-response curve obtained by using 5 different sample concentrations (6.25, 12.5, 25, 50, and 100 µg/mL). Analyses were made in triplicate for each condition.

Statistical analysis: All data were expressed as means ± SD. The data were analyzed by a one-way ANOVA. Mapping used GraphPad Prism 5 (GraphPad Software, San Diego, CA). **p* < 0.05, ***p* < 0.01, ****p* < 0.001 were considered statistically significant.

Contents

Traditional Medicines as Sources of Bioactive Compounds

(Guest Editors: Giovanni Vidari and Paola Vita Finzi)

Original Paper

- An Unprecedented High Content of the Bioactive Flavone Tricin in *Huperzia* Medicinal Species Used by the Saraguro in Ecuador** Chabaco Armijos, Jorge Ponce, Jorge Ramírez, Davide Gozzini, Paola Vita Finzi and Giovanni Vidari 273
- Effect of Three *Centaurea* Species Collected from Central Anatolia Region of Turkey on Human Melanoma Cells** Alessandra Russo, Venera Cardile, Adriana C.E. Graziano, Daniela Rigano, Abdurrahman Aktumsek, Gokhan Zengin and Felice Senatore 275
- Phenolic Compounds from the Fruits of *Medemia argun*, a Food and Medicinal Plant of Ancient Egypt** Milena Masullo, Arafa I. Hamed, Usama A. Mahalel, Cosimo Pizza and Sonia Piacente 279
- Vasorelaxant Effect of a *Baccharis trimera* Infusion on Precontracted Rat Aortic Rings** Maria. A Gómez, Ignacio Miguez, Maria Caggiani, Ximena Arias, Mariajose Laprovitera, Fabiana Blanco, Maria Veronica Cesio, Eduardo R. Migliaro and Horacio Heinzen 283
- Compositional Analysis of *Lavandula pinnata* Essential Oils** Maria Pia Argentieri, Barbara De Lucia, Giuseppe Cristiano and Pinarosa Avato 287

Accounts/Reviews

- Phytochemistry and Ethnopharmacology of Some Medicinal Plants Used in the Kurdistan Region of Iraq** Hawraz Ibrahim M. Amin, Mohammed F. Ibrahim, Faiq H. S. Hussain, Abdullah Sh. Sardar and Giovanni Vidari 291
- Phytochemistry and Ethnopharmacology of the Ecuadorian Flora. A Review** Omar Malagón, Jorge Ramírez, José Miguel Andrade, Vladimir Morocho, Chabaco Armijos and Gianluca Gilardoni 297
- Bioactive Compounds from Plants Used in Peruvian Traditional Medicine** Olga Lock, Eleucy Perez, Martha Villar, Diana Flores and Rosario Rojas 315
- Medicinal Plants Used in Mali for the Treatment of Malaria and Liver Diseases** Mahamane Haidara, Geneviève Bourdy, Nunziatina De Tommasi, Alessandra Braca, Korotoumou Traore, Sergio Giani and Rokia Sanogo 339
- A Review of Traditional Medicinal Plants from Kachin State, Northern Myanmar** Hnin Thanda Aung, Myint Myint Sein, Mya Mu Aye and Zaw Min Thu 353

- A New Iridoid from the Aerial Parts of *Hedyotis pilulifera*** Nguyen Thi Hoai, Ho Viet Duc, Nguyen Dinh Quynh Phu, Takeshi Kodama, Takuya Ito and Hiroyuki Morita 365
- A New Degraded Sesquiterpene from the Twigs of *Trigonostemon lutescens*** Yan-Bo Zeng, Shan-Shan Ma, Zhi-Kai Guo, Bei Jiang, Wen-Li Mei and Hao-Fu Dai 369
- Cytotoxic Compounds from Aerial Organs of *Xanthium strumarium*** Janet Piloto Ferrer, Iris Catiana Zampini, Ana Soledad Cuello, Marbelis Francisco, Aylema Romero, Dayana Valdivia, Maria Gonzalez, Carlos Salas, Angel Sanchez Lamar and Maria Inés Isla 371
- Diterpenoids from Leaves of *Rubus chingii*** Jicheng Shu, Yingzheng Huang, Hangqing Cui, Caiying Peng, Jianqun Liu and Huilian Huang 375
- Synthesis of 5,19-(2,6-Dimethylpyridin-4-yl)-trisinorlupane and Oleanane** Elena V. Salimova, Elena V. Tretyakova, Lyudmila V. Parfenova and Victor N. Odinkov 377
- Colochirosides A₁, A₂, A₃, and D, Four Novel Sulfated Triterpene Glycosides from the Sea Cucumber *Colochirus robustus* (Cucumariidae, Dendrochirotida)** Alexandra S. Silchenko, Anatoly I. Kalinovsky, Sergey A. Avilov, Pelageya V. Andryjaschenko, Pavel S. Dmitrenok, Vladimir I. Kalinin, Ekaterina A. Yurchenko and Igor Yu. Dolmatov 381
- Cytotoxic Aporphines from *Artabotrys crassifolius*** Tan Kok Kwan, Fiona Shipton, Nadiyah Syafiqah Nor Azman, Shahadat Hossan, Khoo Ten Jin and Christophe Wiart 389
- A Novel Alkaloid Isolated from *Spiranthera atlantica* (Rutaceae)** Michelle Rodrigues e Rocha, Carolina Passos da Cunha, Raimundo Braz Filho and Ivo J. Curcino Vieira 393
- Comparison of Seeds of *Colchicum speciosum* and *Gloriosa superba* in respect to Colchicine and Colchicoside Contents by RP-LC** Mehmet Gumustas, Derya Çiçek Polat, Ceyda S. Kılıç, Kemalettin Akalın, Sibel A. Ozkan and Maksut Coşkun 397
