ABSTRACT

Three unpublished fossil primate specimens from Patagonia (Argentina) are reported here. They are part of the Tournouër collection housed at the Muséum national d'Histoire naturelle in Paris, France, and correspond to a partial mandible collected in 1902, and one upper deciduous premolar and one upper permanent molar collected in 1899. The partial mandible comes from the early Miocene sediments in the Coyle river area (Santa Cruz Province, Argentina), and is attributable to *Homunculus patagonicus* Ameghino, 1891. It adds to the several specimens assigned to *Homunculus patagonicus* that were collected since the times of the Ameghino brothers in the area, between the rivers Coyle and Gallegos. Two other dental specimens came from Colhue-Huapi (Chubut province, Argentina). Both are here assigned to *Mazzonicebus almendrae* Kay, 2010, the only known fossil primate in the early Miocene levels of Gran Barranca, in the Colhue-Huapi area. This contribution provides new morphological information concerning the mandible and dentition of *Homunculus* Ameghino, 1891, and the first evidence of the deciduous dentition of *Mazzonicebus* Kay, 2010.

RÉSUMÉ

Spécimens non publiés de primates fossiles de Patagonie (Argentine) de la collection Tournouër du Muséum national d'Histoire naturelle, Paris.

Trois spécimens non publiés de primates fossiles de Patagonie (Argentine) sont étudiés ici. Ils font partie de la collection Tournouër conservée au Muséum national d'Histoire naturelle à Paris, France, et correspondent à une mandibule partielle recueillie en 1902, une prémolaire supérieure caduque et une molaire permanente supérieure recueillies en 1899. La mandibule partielle provient des sédiments du Miocène inférieur dans la région de la rivière Coyle (Province de Santa Cruz, Argentine), et est attribuable à *Homunculus patagonicus* Ameghino, 1891. Par ailleurs, entre les rivières Coyle et Gallegos, plusieurs spécimens attribués à *Homunculus patagonicus* ont été collectés depuis l'époque des frères Ameghino. Les deux autres spécimens dentaires proviennent de Colhue-Huapi (Province de Chubut, Argentine), et sont ici assignés à *Mazzonicebus almendrae* Kay, 2010, l'unique primate fossile connu dans les niveaux du Miocène inférieur de Gran Barranca, région de Colhue-Huapi. Cette contribution fournit de nouvelles informations morphologiques sur la mandibule et la dentition de *Homunculus* Ameghino, 1891, et est la première preuve de dentition lactéale de *Mazzonicebus* Kay, 2010.

Argentine,
collection Tournouër.

INTRODUCTION

The platyrhine primates, or New World Monkeys (NWM) are a diverse group of mammals currently distributed in the Neotropical Region (Morrone 2006), but whose past populations expanded also into the Caribbean Greater Antilles and as far south as Patagonia (see Tejedor & Novo 2017).

The platyrhine fossil record is relatively diverse, but scarce in comparison with other mammals occurring at the same paleontological sites. A total of 33 extinct platyrhine genera have been described thus far from Central and South America, as well as some Caribbean islands, and at least four extinct species of two living genera (Tejedor & Novo 2017). The oldest records are from ?late Eocene of Santa Rosa, Peru (Bond *et al.* 2015). But the richest locality based on the taxonomic diversity and number of primate specimens, are the middle Miocene La Venta localities in Colombia, with 11 genera, followed by the Miocene localities of Patagonia, with 8 genera (see Tejedor & Novo 2017, and the recent discoveries by Marivaux *et al.* 2016).

Here we report three previously unpublished specimens of fossil primates from Patagonia, Argentina, from the paleontological collection at the Muséum national d'Histoire naturelle (MNHN.F), Paris. These are part of the Tournouër collection. André Tournouër was a geologist and explorer born in Paris in 1871. He moved to Mendoza Province, Argentina, in the 1890s, where he raised cattle. Following the advice of Albert Gaudry, a French geologist, paleontologist and by then professor at the MNHN, Tournouër made several trips between 1898 and 1904 to the Argentine Patagonia collecting fossil mammals from beds of the Casamayoran, Deseadan, Colhuehuapian, Santacruzan and Lujanian South American Land Mammal Ages (SALMAs) (Tournouër 1902, 1903a, b, 1914, 1922; Gaudry 1902a, b, c, 1904, 1906a, b, 1908; Simpson 1964, 1984; Madden & Scarano 2010).

As a result of those expeditions, Tournouër contributed a considerable amount of Cenozoic fossils to the MNHN

(Buffetaut 2013) but the primates, although identified at the collection, were never described or published. We found only a brief comment in Gaudry (1906b: 26): “Il a inscrit sous le nom d'*Homomculus* une petite bête dont la tête est grande comme celle d'un Ouistiti (1). N'ayant dans nos collections que des pièces incomplètes d'*Homomculidés*, je ne veux pas donner une opinion personnelle. Je peux dire seulement que d'après les découvertes faites jusqu'à présent, il n'y a pas eu en Patagonie de Singes anthropomorphes”.

The three previously unreported fossil primates we describe here include a partial mandible collected in 1902, here assigned to *Homunculus patagonicus* Ameghino, 1891, and a deciduous upper premolar and one permanent upper molar collected in 1899, here assigned to *Mazzonicebus almendrae* Kay, 2010. Both genera are monotypic taxa. These specimens provide new morphological information of the mandible and dentition of *Homunculus* Ameghino, 1891, and the first evidence of the deciduous dentition of *Mazzonicebus* Kay, 2010.

SYSTEMATIC PALEONTOLOGY

Order PRIMATES Linnaeus, 1758
 Suborder ANTHROPOIDEA Mivart, 1864
 Parvorder PLATYRRHINI E. Geoffroy, 1812
 Family PITHECIIDAE Mivart, 1865
 Subfamily Homunculinae Ameghino, 1894
 Genus *Homunculus* Ameghino, 1891

Homunculus patagonicus Ameghino, 1891

NEOTYPE.—MACN-A 5757; partial mandible preserving a complete and worn dentition lacking crowns of the left canine and the incisors. This is a replacement (see Tejedor & Rosenberger 2008) for the lost holotype specimen, MACN-A 634.

GEOGRAPHIC AND STRATIGRAPHIC PROVENANCE.—The neotype MACN-A 5757 comes from Corriguen Aike (= Puesto Estancia La Costa), on the Atlantic coast of Santa Cruz Province between the rivers Coyle and Gallegos, Argentina. Santa Cruz Formation, late-early Miocene (Burdigalian Age), c. 17.5 to 16.7 Ma (Tauber 1997; Fleagle *et al.* 2012).

NEW REFERRED MATERIAL.—**MNHN.FSCZ215** (Fig. 2A-C), partial mandible preserving the left ramus with alveoli for left i1-2, c, p2, broken alveoli of p3-4, and complete m1; alveoli for right i1-2, and broken c.

GEOGRAPHIC AND STRATIGRAPHIC PROVENANCE.—**MNHN.FSCZ215** is labeled as “*Homunculus* // Coyle 1902-6” (Fig. 2E). Thus, the provenance is certainly nearby the Coyle river on the Atlantic coast of Santa Cruz Province, Argentina. Santa Cruz Formation, late-early Miocene (Burdigalian Age) (see Marshall 1976; Tauber 1997; Buffetaut 2014), approximately 16.1-16.5 Ma (Fleagle *et al.* 2012) (Fig. 1).

DESCRIPTION

Based on comparisons, the mandible **MNHN.FSCZ215** is indistinguishable from the cast of the lost MACN-A 634, the type of *Homunculus patagonicus*. MACN-A 634 is strongly worn but shows several morphological similarities at the alveolar level as well as the crown outline and size of m1. The size and orientation of the alveoli indicate that the specimen had small roots and procumbent, staggered incisors, producing a V-shaped mandible. The small alveolus for the left canine, similar in size to the alveolus of p2, indicates that the canine was small, as seen in the neotype of *Homunculus patagonicus* (MACN-A 5757) (Tejedor & Rosenberger 2008).

Compared to MACN-A 635, this specimen has slightly larger alveoli for the canines and a somewhat more robust mandible. Remarkably, the m1 of this new specimen is one of the best preserved lower molars attributed to *Homunculus*. Its morphology resembles MACN-A 5969b. It has two roots and the trigonid is higher than the talonid, with moderately high and sharp crests. The preprotocristid extends forward closing the trigonid mesially; the paraconid is absent, and there is an oblique cristid connecting the preparacristid. The metaconid is the highest cusp, and is situated relative to the protoconid in a more distal position. The hypoflexid appears relatively deep. It shows a tiny cuspule as seen in the m1 of MACN-A

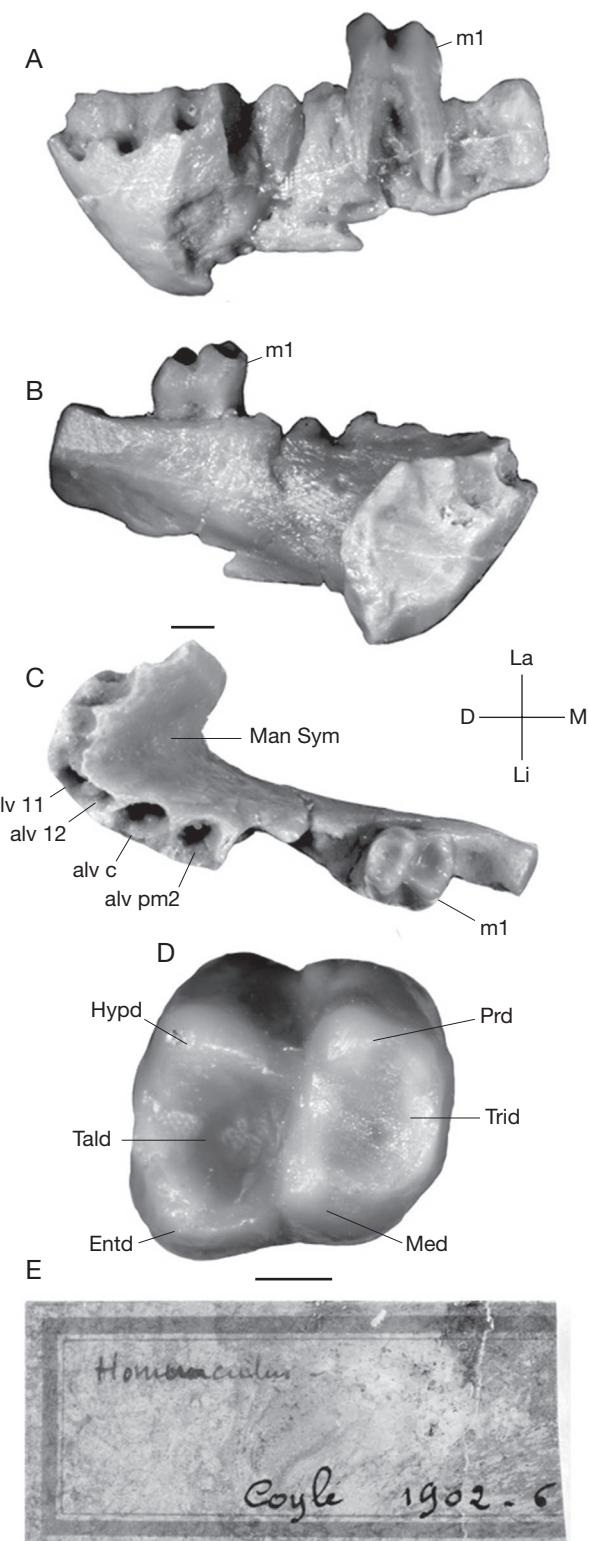

FIG. 1. — **MNHN.FSCZ215**, partial mandible of *Homunculus patagonicus* Ameghino, 1891 with left m1 in lateral left (A), lateral right (B) and dorsal (C) views; D, m2 of **MNHN.FSCZ215**; E, **MNHN.FSCZ215** identification label from MNHN. Abbreviations: **alv i1**, first incisor alveolus; **alv i2**, second incisor alveolus; **alv c**, canine alveolus; **alv pm2**, second premolar alveolus; **Man Sym**, Mandibular symphysis; **Hypd**, Hypoconid; **Prd**, Protoconid; **Trid**, Trigonid basin; **Med**, Metaconid; **Entd**, Entoconido; **Tald**, Talonid basin. Orientation abbreviations: **D**, Distal; **La**, Labial; **M**, Mesial; **Li**, Lingual. Scale bar: 1 mm.

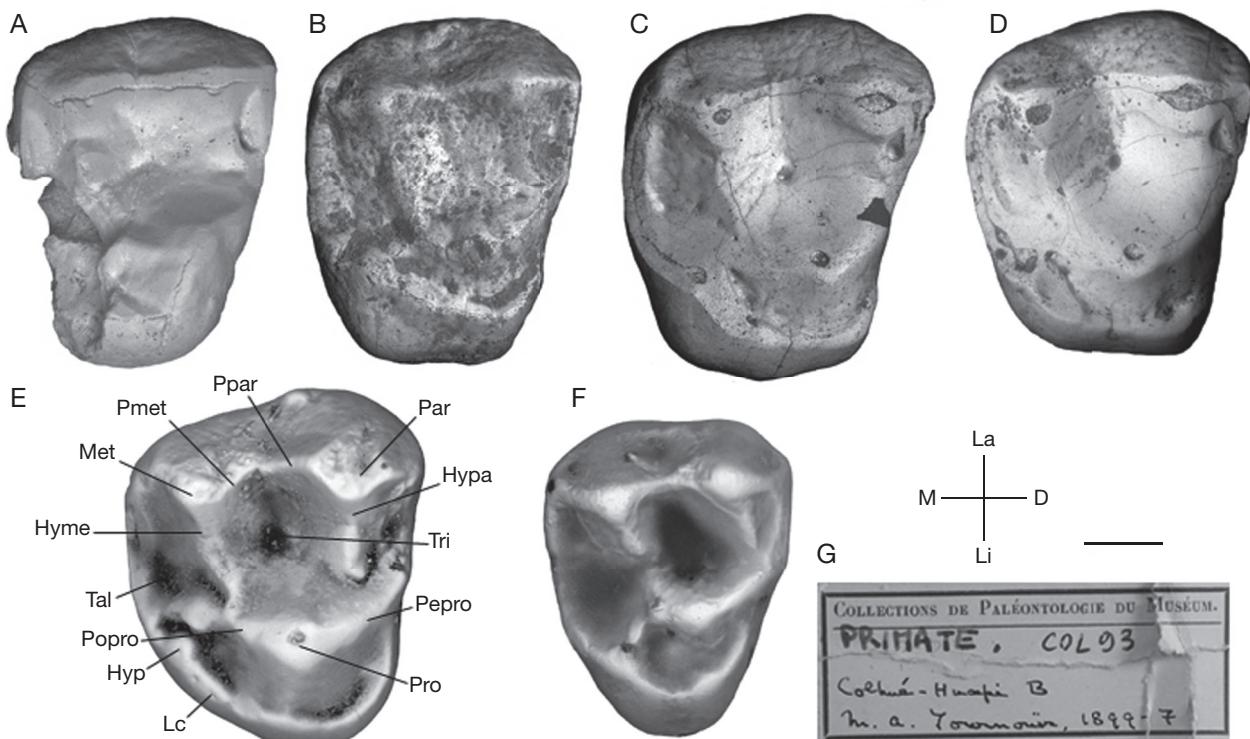

FIG. 2. — **A**, M2 to MPEF-PV 10970; **B**, MPEF-PV 5342; **C**, MPEF-PV 5347b; **D**, MPEF-PV 5699 (mirror image); **E**, MNHN.F.COL93b (mirror image); **F**, MNHN.F.COL93a (mirror image); **G**, MNHN.F.COL93b and MNHN.F.COL93a identification label from MNHN. Abbreviations: **Hyp**, Hypocone; **Pro**, Protocone; **Tal**, Talon basin; **Tri**, Trigon basin; **Met**, Metacone; **Lc**, Lingual cingulum; **Pepro**, Preprotocrista; **Hypa**, Hypoparacrista; **Par**, Paracone; **Ppar**, Postparacrista; **Pmet**, Premetacrista; **Hyme**, Hypometacrista; **Popro**, Postprotocrista. Orientation abbreviations: **D**, distal; **La**, labial; **M**, mesial; **Li**, lingual. Scale bar: 1 mm.

5969b. The molar has a long cristid obliqua reaching the trigonid wall lingual to the protoconid, while the hypoconid is displaced labially. The entoconid is lower than the hypoconid, with a long entocristid. The talonid basin is relatively wide and deep, showing an incipient and centrally placed hypoconulid (Fig. 2).

Subfamily PITHECIINAE Mivart, 1865

Mazzonicebus almendrae Kay, 2010

HOLOTYPE. — MPEF-PV 6752, partial mandible preserving the symphysis and left 11-M1.

GEOGRAPHIC AND STRATIGRAPHIC PROVENANCE. — Colhue-Huapi, West locality, Gran Barranca, Chubut Province, Argentina. The material was collected in the Lower Fossil Zone, Colhue-Huapi Member, Sarmiento Formation, dated between 20.0 and 20.2 Ma (Ré et al. 2010).

NEW REFERRED MATERIAL. — MNHN.F.COL93a, left dP4; MNHN.F.COL93b, left M2.

GEOGRAPHIC AND STRATIGRAPHIC PROVENANCE. — The specimen label reads (Fig. 3G): “Primate, col 93 // Colhue Huapi B // M.A. Tournouer, 1899-7”. Both specimens were found in the box with the same label. Thus, the provenance is certainly Gran Barranca in Chubut Province, Argentina. The Colhue-Huapi Member of the Sarmiento Formation is, early Miocene (Burdigalian Age) (see Simpson 1964; Madden & Scaramo 2010 and references therein), approximately 20.0-20.2 Ma (Ré et al. 2010).

DESCRIPTION

MNHN.F.COL93a (Fig. 3F), is a three rooted dP4 with unworn paracone, metacone placed more labially, and a well-developed protocone, as well as a hypocone placed on the distolingual cingulum. It has a morphological pattern similar to that known for the upper molars of *Mazzonicebus almendrae*. This tooth is smaller than M1-2 although larger than M3. It is similar in size and general aspect to the M2 of *Soriacebus ameghinorum* Fleagle, Powers, Conroy & Watters, 1987, as in MACN-PV SC67, differing in that MNHN.F.COL93a has a more lingually expanded lingual cingulum which produces a triangular crown outline. One important difference is that the talon basin is distally expanded in MACN-PV SC67.

The upper deciduous dentition is not known for either *Mazzonicebus* or *Soriacebus* Fleagle, Powers, Conroy & Watters, 1987 and, in general, the deciduous dentition is scarcely known for any fossil primates from Patagonia. A dP4 assigned to *Dolichocebus gaimanensis* Kraglievich, 1951 (MACN-PV CH1011), provides a general morphological model of a deciduous tooth for the Patagonian platyrhines. Both these teeth have similar sub-triangular outlines due to the narrow lingual expansion of the lingual cingulum. This combination of features is usually seen in the dP4s of *Carlocebus carmenensis* Fleagle, 1990 (e.g. MACN-PV SC113), and in the dP4 present in the juvenile cranium of *Homunculus patagonicus*, MPM-PV 3505 (Perry et al. 2014). MACN-PV CH1011 shows the strong hypometacrista connected to the postprotocrista, unlike that weakly developed, without connection to the postprotocrista, exhibited by MNHN.F.COL93a. In addition,

TABLE 1. — Size differences between *Homunculus patagonicus* Ameghino, 1891 and *Mazzonicebus almendrae* Kay, 2010.

Specimen	MD (mm)	BL (mm)
<i>Homunculus patagonicus</i>		
MNHN.F.SCZ215 (m1)	4.48	3.91
MACN-A 5757 (right m1)	4.68	4.73
MACN-A 5969b (m1)	4.5	3.83
<i>Mazzonicebus almendrae</i>		
MNHN.F.COL93a (dP4)	3.38	3.9
MNHN.F.COL93b (M2)	3.96	4.32
MEPEF-PV 5486 (M2)	3.52	5.11
MEPEF-PV 5342 (M2)	3.86	4.68
MEPEF-PV 5347 (M2)	4.02	4.89
MEPEF-PV 5699 (M2)	4.11	4.96

they differ in that the prehypocrista in MNHN.F.COL93a is oriented more lingually with respect to the distolingual orientation observed in MACN-PV CH1011.

Regarding the remaining tooth reported here, the comparisons between MNHN.F.COL93b and the upper molars assigned to *Mazzonicebus almendrae* indicate that the size (Table 1) and morphology of the M2 match well with the M2s MPEF-PV 5699, MPM-PV 5342, and MPEF-PV 5347b; however, the lingual cingulum is less expanded anterolingually, and the molar has a very small hypocone. Its occlusal outline is more rounded instead of the nearly trapezoidal shape in *Mazzonicebus*. An unusual condition is seen in the hypocone development in MNHN.F.COL93b, which is divided in two tiny cusps separated by a sulcus. The metacone is aligned somewhat more lingually with respect to the paracone, and the postparacrista descends to join the premetacrista in a middle position. The protocone is well developed and has a preprotocrista reaching a shallow mesial fovea. The molar has a distinct hypoparacrista descending from the paracone, and a hypometacrista that reaches the postprotocrista at the intersection of the prehypocrista.

Other morphological characters of the M1 are shared with *Mazzonicebus*. For example, the cusps are moderately developed, with similar outline and depth of the trigon, a strong preprotocristid without a paraconule, talon distally expanded, and a mesial fovea is present.

On the other hand, MNHN.F.COL93b (Fig. 3E) was also compared with *Soriacebus ameghinorum*, especially the M1 of MACN-PV SC67, a maxillary fragment with well preserved M1-2. It is similar in size, has a strong preprotocrista, with the postprotocrista distally oriented to reach the hypocone, and a mesial fovea is present. MNHN.F.COL93b has a more rounded outline, but is also buccolingually shorter, and the talon is not so expanded distally as in MACN-PV SC67. The lingual cingulum is definitely more developed in MACN-PV SC67, with a strong anterolinguinal extension, and the hypocone is also more developed. These are the two most distinctive characters separating MNHN.F.COL93b and *Soriacebus*. In addition, MACN-PV SC67 has a more expanded labial side in M1-2.

Although *Mazzonicebus* and *Soriacebus* are closely related (see Tejedor & Novo 2017), these comparisons reinforce the idea that MNHN.F.COL93b is an M2 of *Mazzonicebus* and not an M1 of *Soriacebus* (see size differences in Table 1).

FIG. 3. — Map of central and eastern Patagonia modified from Tournouër (1922). Arrows pointing "Coli Huapi" and Río Coylet.

DISCUSSION AND CONCLUSIONS

NEW SPECIMEN OF *HOMUNCULUS PATAGONICUS*

The comparative morphological study mentioned above allows us to assign the previously undescribed mandible MNHN.F.SCZ215 to *Homunculus patagonicus*. The dental morphology of *Homunculus* resembles the extant pitheciid *Callicebus*, while the mandible is closer to the living *Aotus* (Tejedor 1997, 2000; Tejedor & Rosenberger 2008). However, in alternative phylogenetic views, *Homunculus* is positioned both as part of a stem platyrhine group within the Patagonian primates (excepting *Proteropithecia* Kay, Johnson & Meldrum, 1998, *Chilecebus* Flynn, Wyss, Charrier & Swisher, 1995 and *Branisella* Hoffstetter, 1969 (Kay 2015), or as part of the crown Platyrhini in the subfamily Homunculinae among the pitheciids (Rosenberger *et al.* 1990; Tejedor 2000; Tejedor & Rosenberger 2008; Bond *et al.* 2015; Novo 2015; Tejedor & Novo 2017). The latter hypothesis is supported here.

Although the fossil record of *Homunculus* is represented by approximately forty specimens, including skulls, mandibular

fragments, isolated teeth and postcranial material (Ameghino 1891; Bluntschli 1931; Tauber 1991; Tejedor 2000; Tejedor & Rosenberger 2008; Perry *et al.* 2010; Kay *et al.* 2012; Perry *et al.* 2014; Novo 2015), the controversies around the phylogenetic relationships of the genus remain under debate.

The specimen reported here provides valuable information about the mandibular morphology and possible generic variability (or sexual dimorphism? e.g., the extreme size difference of the alveolus for the canine with respect to MACN-A 635), and exhibits one of the best preserved lower molars known for the genus.

THE NEW SPECIMENS OF *MAZZONICEBUS ALMENDRAE*

The specimens MNHN.F.COL93a and COL93b, here attributed to *Mazzonicebus almendrae*, have been labeled as collected in the year 1899, according to the MNHN information. Thus, they could have been the second record of pre-Pleistocene fossil primates in Argentina after *Homunculus patagonicus*. Instead, the genus *Mazzonicebus* was not described until more than 100 years later (Kay 2010).

When Kay (2010) described *Mazzonicebus*, from the Colhue-Huapi member, Sarmiento Formation at Gran Barranca, he included new specimens as well as others previously reported and housed at the Museo de La Plata. One of them is a symphysis preserving a right p4, MLP 69-III-12-2, collected at Gran Barranca by Robert Goulet in 1967; the specimen was formerly referred to cf. *Homunculus patagonicus* by Hershkovitz (1981), and then to *Soriacebus* cf. *ameghinorum* by Fleagle (1990). Kay (2010) noted that MLP 69-III-12-2 was the first record of primates coming from Gran Barranca, adding that, even with the efforts of renowned field expeditions since the times of the Ameghino brothers, and later by the George G. Simpson's expeditions to Patagonia in the 1930s, no primates were found by then. Incidentally, the new material described here was collected well before 1967, in the year of 1899, as indicated in the label.

André Tournouër was a colleague, perhaps a friend and competitor of the Ameghino brothers, and apparently there was controversy about who was the actual discoverer of Gran Barranca (Madden & Scarano 2010). According to Tournouër's publications about his travels to Patagonia, and later investigations about the origin of the fossils from Tournouër collection, the specimens that are labeled Colhue-Huapi ("Coli-Huapi" as he spelled it, Tournouër 1902, 1903a, b) would all have come from the Colhuehuapian levels at Gran Barranca (Simpson 1964; Madden & Scarano 2010).

Mazzonicebus is closely related to *Soriacebus*, from the Pinturas Formation, even according to the two different views on their higher-phylogeny interrelationships, as explained above for the case of *Homunculus* and other Patagonian primates. In our view, *Soriacebus* and *Mazzonicebus* are extinct members of the Pitheciidae, and part of the subfamily Pitheciinae (Rosenberger *et al.* 2009; Tejedor 2013; Tejedor & Novo 2017; *contra* Kay 2015).

In sum, the new specimens of *Mazzonicebus* reported here provide the first evidence of deciduous dentition for the genus, as well as some historic evidence about the ancient discoveries of fossil platyrhine primates in South America.

Acknowledgements

We are grateful to the Muséum national d'Histoire naturelle, Paris and to Guillaume Billet for authorizing the access to the Tournouër collection and for providing the cast of the unpublished specimens. To the Museo Paleontológico "Egidio Feruglio" and especially to Eduardo Ruigomez for authorizing the access to *Mazzonicebus* specimens. To ALUAR (Aluminios Argentinos, Puerto Madryn) and J. Groizard for providing access to the Scanning Electron Microscope to take the pictures. We also thank the A. Rosenberger and J. Fleagle for their helpful comments. This work was partially funded by CONICET and the projects PICT 2015-2036 to NMN y PICT 2014-1818 to MFT.
